

Northstar Continuity Review

This report is a deterministic fixture for proving that handoff evidence keeps native text, tables, page locations, images, and validation boundaries together.

Workstream	State	Evidence	Owner
Canonical store	Complete	42 fixture assertions	Platform
Merge planner	In progress	Conflict ledger green	Runtime
Hosted launch	Deferred	Local preview only	Operations

Decision: preserve local/offline proof separately from hosted and provider proof. Do not remove the source hashes or the explicit Do Not Touch rules.

Readiness evidence

The chart shows that canonical evidence and browser validation are ahead of hosted proof. A continuation plan must keep hosted launch as deferred until an environment-specific validation exists.
